

TLS Approach Guidance – Reference Extract

From Operators Manual – 020-00072 (Rev F, Page 4-3)

"When a pilot requests a TLS approach, the approach controller will enter the transponder code in the RCU interface and clear the pilot to conduct the approach. The TLS software searches all of the transponder replies for this code... Only after this process does the TLS compute the guidance and transmit LOC & GS signals."

Conclusion:

The aircraft will NOT receive LOC & GS signals unless the operator enters the transponder code into the RCU manually.

“Therefore, Mr. Karl, the TLS must be integrated with the Tower so that the controllers can enter the transponder ID for each arriving aircraft.”
