

Interrogation with Suppression Option

What it is: Antenna unit that sends interrogation signals to transponders. What it does: Queries aircraft transponders for identification and altitude, with suppression to reduce interference.

ESA (Elevated Support Assembly) with Guy Wires

What it is: A tall support tower stabilized with guy wires. What it does: Provides elevation for antennas to maximize coverage, ensuring stability.

ASA with Omni-Directional Antennas

What it is: Support frame holding multiple omni-directional antennas. What it does: Provides 360° coverage for signal transmission and reception.

Cal/BIT with Directional Antenna

What it is: Calibration/Built-In Test antenna. What it does: Emits test signals to verify system operation, directional beam must face target.

ATA with Omni-Directional Antenna

What it is: Auxiliary Test Antenna. What it does: Provides uniform omni-directional coverage, used in diagnostics and redundancy.

High-Gain Uplink Antennas

What it is: Tall tower with multiple Yagi-type high-gain antennas. What it does: Transmits strong, focused signals towards aircraft for long-range communication.

Completed Uplink Tower

What it is: Fully built operational uplink tower. What it does: Localizer guides horizontal alignment, Glide Slope guides vertical descent.

Completed ESA Tower

What it is: Installed ESA with guy wires in real field environment. What it does: Provides elevation and stability for antennas, ensuring optimal landing operations.

Deployed ASA with Omni Antennas

What it is: Field-mounted ASA with multiple omni antennas. What it does: Offers full 360° monitoring capability with redundancy in real conditions.
